## Guidelines and Explanation of Terms

**Tested heating system efficiency (minimum 82%):** This is the combustion efficiency test typically performed by a heating technician when servicing and cleaning the burner.

**Floors over unheated areas:** Examples are an enclosed porch or a crawlspace. Doesn't refer to a basement.

**Basement wall:** Basements in many new buildings are insulated all the way to the floor or footings (full height). Older buildings may have poor soil drainage, e.g. a wet basement. To avoid potential foundation damage from damp soils freezing and expanding, it is generally considered safe to insulate to 1'-2' below ground level. This still saves considerable energy.

**Windows:** Sealed double glazing sometimes has gas fill such as argon or krypton. Low-e storm windows are also available. Either exceeds the basic single glass + storm.

**Doors:** A solid wood door is only a bit more insulating than a single pane of glass. Adding a storm door cuts heat loss in half. An insulated door can equal almost 10 panes of glass.

**Refrigerator:** Refrigerators made before 1995 have the make and model information on a metal plate inside, usually on the door. From 1995 on, the information is on a sheet of metal *foil*.

**Gas stove:** According to the U.S. Department of Energy, piloted gas burners can use more than twice the energy used by electric ignition gas burners.
